49 FAG WiPro: Biggest success so far for F'IS Australia

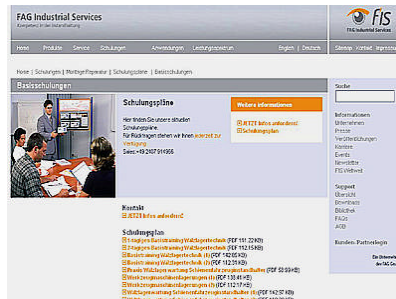

The Australian F'IS subsidiary, CSMA, has managed to secure an order for a total of 49 WiPro systems, prevailing under enormous competitive pressure and scoring its biggest success so far. The crucial factor in the customer's – a leading supplier in the field of renewable energies – decision to buy the system was the successful installation of WiPro units for a test period. During this period, the customer was able to convince itself of the high quality of the product and the excellent service provided by the F'IS staff. By having two wind parks extensively monitored by 49 WiPro systems, the customer is making sure that it has its turbines well under control at any time. Maintenance can now be scheduled optimally as, for example, repair work can be planned for calm periods.

Positive response to Schaeffler steel workshop

Many customers from the steel and aluminium industries had accepted the invitation of F'IS and INA / FAG to attend the steel workshop on November 2 and 3, 2005 in Wuppertal. They were extremely satisfied with the event and emphasized in particular its great practical benefit. The roughly 60 participants were shown ways to increase productivity and quality by using the latest rolling bearing technology and services. In addition to lectures delivered by Schaeffler colleagues, the participants heard practice reports from a number of plant operators. A tour of the large-bearing production facilities of the FAG Wuppertal plant showed that reconditioning of large bearings is a sensible alternative to the purchasing of new large bearings. In view of the positive response, F'IS will hold a similar event on November 8 and 9, 2006.

Training schedules 2006 available on F'IS web site

The training schedules for next year are now available as downloads on the F'IS web site. The range of activities comprises training seminars in the fields of rolling bearing engineering and condition monitoring. The seminars are intended both for customers and F'IS partners (certification) and will be held at our training centers in Hirschaid and Herzogenrath and, on request, at customers' places. In addition to the standard training seminars, we can also offer seminars from all fields of activity of F'IS (mounting, monitoring, lubrication, alignment and maintenance management) that are tailored to a customer's specific needs.
